

Last week went very smooth as I researched my failure to success story and made small discussion with my classmates about their findings in their own stories. I am continuing to effectively manage my schedule to balance work, school, family, and fun.

Recently I've built upon my coding skills by going to Lynda.com and taking the HTML essentials course. I have also started to build my own portfolio page from scratch using the HTML skills I have learned.

So what's next for me is to revisit the C# coding language to build and improve on the little coding knowledge I have established already. I believe this will better prepare me for the up coming coding classes and make my journey throughout Full Sail one to enjoy. Going into a class with a clear understanding of the material, will only help me go above and beyond the normal standard.

Coding is a very new style of work for me, as I do not have a coding or proper computer background; I am not saying I am computer illiterate. What I do have is a will and a want to learn something new. So the way in which I plan to revisit and improve upon the knowledge of C# and other coding, is by taking the courses on Lynda.com plus my classes here at Full Sail, because they cover many languages and all their aspects and this can help me become the coder I desperately hope to become.
