

With 12 years of real world work experience under my belt I have been in several different positions. During this time I have had the opportunity to manage projects from start to finish. Being in charge of price quoting, money management, and the execution of the project. There have been jobs where I have made lots of money from proper budgeting and execution, and had some that were not budgeted so well.

Because of my successes and failures I have developed an understanding for the importance of efficient project management. Over the last seven months I have studied the creative process while refreshing my writing and math skills. The Mobile Development industry is very new to me. In this beginning phase of my student career I have already completed a few exciting projects within the studies of a programming language called C#. I've written programming that's able to calculate and record information. More specifically I have coded an amortized loan calculator, a program to record golf scores, and a golf handicap calculator.

Currently I am taking more classes to develop the required skills to make an impact in the mobile industry. Being proactive in my current course is helping me with time management issues. Properly balancing work, school, family, and fun will help me with staying focused. Over the next few weeks I will be building the foundation of my professional portfolio. Taking a look back at the work I have done will let me know where I started and the progress I have made so far in my journey. I am looking forward to gaining more experience and developing new skills for my profession.
