

Over the past week I have started to construct a portfolio for my professional career by creating a repository on GitHub.com. It is a place I can store and version control all of the work I have done so far in my journey; and share it with people of the same interests. Though this process was very frustrating at times, I have learned some of the basic uses for a terminal and have studied the git commands through the website Lynda.com.

At this time I am trying to better my coding skills; so in future classes it will not be so difficult adapting to something I have never used before. Lynda.com is a tremendous help in this process. I have also been working on my typing skills, trying to relearn typing without looking at the keys and using the proper fingers, by utilizing typing games and just practicing in my everyday life (work, school, ext.).

What's next for me is to continue being proactive on all my assignments and to build upon my portfolio project by adding new material as I complete assignments. I will also continue to research and develop new skills in coding and break my bad typing habits. The future holds great things for me I just have to stay on my path and open new doors along the way.

Perseverance and proactivity are my friends and my best strengths. I will continue to conduct my own personal research on my own time and stay focused in all my courses ahead so I can advance my career in the mobile development industry.
