

### **Week in Review:**

This week I have research a story of a product that started as a failure and ended as a success. The story gave me confidence within myself because it let me know that failures are just learning experiences. I experienced some failures to successes this week in my research and development by choosing to go to Lynda.com and take the HTML Essentials course. I have completed this course in full and have received a certificate for completion that I have stored in the resources folder of my portfolio. With the completion I have developed a better understanding for HTML and have been introduced to CSS and JavaScript. The course ran a little long but I seemed to manage my time and complete all my assignments stress free. And the one the assignment I hope to improve on this week is the Reflect and Connect assignment as I was suggested to do so by my instructor.

### **Reflect and Connect:**

I feel I have added tremendous value to my experience in my degree and the skills I posses for future opportunities. By taking the time to research HTML using the amazing resource of Lynda.com. I feel the information that was presented to me in the course resonated well and I have been able to develop a better understanding for the HTML format. I realize that knowing all of the variables and options will take some practice to master, but by having the knowledge containing the understanding of the language, as a whole, it will be a better foundation for my future.

I chose the option of learning HTML because it's the grandfather language for a page's layout. Even though I'm enrolled in the Mobile Development degree program, I believe that knowing the languages that led to the mobile platform will be a great investment to further develop my understanding for the more modern, or recent, code languages. I was noticing with CSS and JavaScript there were some similarities between them and C#.

In this week coming, I am looking forward to switching gears a little by revisiting the C# language to better prepare myself for up coming classes. I plan on using the amazing Lynda.com site to complete this course because I find it to be a very progressive way of learning that I'm adapting to very well. The hands on video demonstration style learning works great for me because I can pause and go back to things I missed or need to revisit. Next week I hope I can end up with a more advanced understanding of the C# language to enable me to be able to progress above the standard.
